The invention relates to a transposon nucleic acid comprising a genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposase is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New transposon nucleic acid comprising a genetically engineered translation stop signal within a transposon end sequence recognized by transposase useful for producing deletion derivatives of polypeptide.

The present invention describes a method for transferring genes to a product vector comprising contacting in vitro a first and second vector and introducing the co-integrate vector into a prokaryotic cell to permit the formation of a product vector. Also described: (1) a pair of vectors (1) comprising: (a) a first vector. Also described: (1) a pair of vectors for the insertion of a gene, a gene encoding a first selectable marker, a double-stranded origin of replication and a site-specific recombination recognition site, where the gene is interposed between the double-stranded origin of replication of a rolling circle replicon and the site-specific recombination recognition site; and (b) a second vector comprising a negative selectable marker, a double-stranded and double-stranded origin of replication of a rolling circle replicon, a site-specific recombination recognition site and a gene encoding a second
                                                                     g

transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end sequence recognized by a transposase, and recovering a target nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a modified Cat-Mu(Stop)-transposon
                                                                                                                                                                             9

contracted the marker, where the gene encoding the negative selectable marker is interposed between the double-stranded origin of replication of a colling circle replication and the site-specific recognition site, where one or both of the vectors have no second site-specific recombinates as it e-specific recombination site between the double-stranded origin of replication of a rolling circle creplication, a site-specific recombination site, (2) a product vector comprising a gene, a double-stranded origin of replication and a nucleic aid sequence encoding a second selectable replication and a nucleic aid sequence encoding a second selectable or replication and a nucleic aid sequence encoding a second selectable creplication of a rolling circle replican and the site-specific recombination recognition site, and (3) a kit for the transfer of gene to or product vector comprising (1) and packaging materials. The method is useful for generating recombinant vectors. These recombinant vectors are useful in expressing mammalian cell and bacterial hosts, purification of the native protein by employing specialised purification tags and detection of interaction with other proteins. The present sequence represents the nucleotide sequence of plasmid pBC SK+, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2874
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2814
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2694
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2994
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2934

The present sequence is that of plasmid pRLS-CAT, a derivative of pckmb 3X which has been modified to contain chloramphenicol resistance. The invention relates to the engineering of plasmids, of which pRL-CAT is a preferred example, for in situ production of genes. It was found that nucleic acids encoding a polypeptide can be directly incorporated into a plasmid by DNA polymerisation or by reverse transcription of a nucleic acids encoding at least a portion of an antibody can be directly incorporated into the plasmid by reverse transcription of mRNA. The plasmids are engineered to contain 2 template annealing sequences (see ABN84079-80 and ABN84082-83), i.e. a downstream correction of a nucleic acid template, e.g. mRNA encoding at least a portion of an antibody, an upstream collar sequence that anneals to a second portion of the template, and at least 1 restriction site located between the 2 template annealing sequences. A single-stranded DNA plasmid vector is produced containing a nucleic acid encoding at least a portion of a polypeptide, e.g. a light chain and/or a heavy chain of an antibody. This vector can be transformed into a host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          comprises two template annealing upstream collar sequence and a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a plasmid with a nucleic acid sequence of $122, 0.583 base pairs fully defined in the specification. The invention more specifically relates to novel vectors capable of replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and B. coli. The new vectors have new vectors include pRL5, pRL5-CAT, pRL5 asc-CAT and pRL5 bsi-CAT. This polymucleotide sequence represents the plasmid pRL5-CAT nucleic acid

The invention more specifically relates to novel vectors capable of replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and B. coli. The new vectors have been designed to overcome certain drawbacks of the pCombJX plasmid. These new vectors include pRL5, pRL5-CAT, pRL5 asc-CAT and pRL5 bsi-CAT. This polynucleotide sequence represents the plasmid pRL5 bsi-CAT nucleic acid

replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and E. coli. The new vectors have been designed to overcome certain drawbacks of the pComb3x plasmid. These new vectors include pRL5, pRL5-CAT, pRL5 asc-CAT and pRL5 bsi-CAT. This polymucleotide sequence represents the plasmid pRL5 CAT-Asc nucleic acid sequence of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated perhydrolase (I), exhibiting a perhydrolysis to hydrolysis ratio that is greater than 1. A composition containing (I) is useful for cleaning. (I) is useful in cleaning, bleaching and disinfecting applications such as paper and pulp bleaching, fabric and garment cleaning, hard surface cleaning and personal care applications (e.g. oral care, hair care, and skin care). (I) is useful in applications where peracid hydrolysis is useful, such as in the clean up of peracids. (I) enables effective cleaning, bleaching and disinfecting over broad pH and temperature ranges. The present sequence represents a M. smegmatis perhydrolase expression vector.

```
The invention relates to an adapter-directed display system for displaying an exogenous polypeptide on the outer surface of a genetic package, comprising an expression vector with a sequence that encodes exogenous polypeptide fused to a first adapter sequence, and a helper vector with outer-surface sequences encoding proteins fused to a second adapter, the polypeptide is produced in a host cell to cause display of the polypeptide. Also included are a helper vector for displaying a polypeptide on the outer surface of a genetic package (comprising, outersurface sequences necessary for packaging the genetic package, where at least one of the surface presenting sequences is fused in-frame to adapter, the adapter acting, when the polypeptide is produced in a suitable host cell, to cause the display of the polypeptide), an suitable host cell, to cause the display of the polypeptide), an suitable host cell, to cause the display of the polypeptide is produced in a suitable host cell, to reaves the display of the polypeptide on the outer surface of a genetic package (comprising acoding sequence encoding the polypeptide fused in-frame to a first adapter, where the vector is devoid of outer-surface sequences encoding any functional outer-surface proteins of the genetic package, is mediated through non-covalent pairwise surface.

contraction between the first adapter and a second adapter, where the second adapter is fused to an outer-surface protein), a kit comprising above vectors in suitable packaging, a host cell comprising the vectors, a second adapter is fused to an outer-surface protein, a kit comprising above vectors in suitable packaging, a host cell comprising the vectors, a calectable display system, a selectable library comprising several genetic package is least one being the expression vector, a selectable library comprising several genetic package is polypeptide on its outer surface using the adapter-directed display system) and detecting the presence of a specific interaction between a test agent and an exogenous polypeptide on its outer surface using the adapter-directed display system) and detecting the presence of a specific interaction between a test agent and an exogenous polypeptide on its outer surface using the adapter-directed display system is useful for complax on the genetic package. The outer-surface sequences are chosen from gene III, gene VII, gene VIII, gene VIII and gene IX of a filamentous phage. The outer-surface sequences encode bacterial outer-surface sequences are homodimerisation of the stable polypeptide-agent complax on the genetic package. This outer-surface sequences are homodimerisation or heterodimerisation sequences. Complax on the outer surface of a genetic package, which involves proteins chosen from Lipponna, Tarl Pabl, Opt.) Inp and AIDAI. The first and second adapters are homodimerisation or heterodimerisation sequences. Consuling the adapter-directed display system is useful for displaying a polypeptide with desired property, which involves proteins and second adapters are decembered by the success of a genetic package that display a polypeptide with desired property solution the genetic package further involves obtaining a polypeptide with desired property solution the genetic package further involves obtaining a polypeptide with desired property is binding specificitie to protein, sec

material f with diol

Manufacture of 3-hydroxy propionaldehyde useful as raw mater manufacturing 1,3-propanediol, by dehydrating glycerol with dehydratase and/or glycerol dehydratase and microbial cells.

Example 1; SEQ ID NO 2; 40pp; Japanese

The invention relates to a method for manufacturing 3-hydroxypropionaldehyde involving dehydrating glycerol with diol dehydratase and/or glycerol dehydratese and microbial cells comprising diol dehydratase reactivation factor and/or glycerol dehydratase reactivation factor and/or glycerol dehydratase reactivation factor along a method for manufacturing 1,3-propanediol, a method for manufacturing 3-hydroxypropionic acid and methods for manufacturing acrolein, acrylic acid and acrylic ester. The dehydration reaction of glycerol is performed under aerobic conditions using microbial cells. This sequence represents plasmid Pl5a DNA used in the method of the invention.

Sequence 6607 BP; 1518 A; 1801 C; 1831 G; 1457 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            109
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     169
                                                                   hydroxypropionaldehyde involving dehydrating glycerol with diol dehydratase and/or glycerol dehydratase and microbial cells comprising diol dehydratase reactivation factor and/or glycerol dehydratase reactivation factor and/or glycerol dehydratase reactivation factor. The invention also relates to a method for manufacturing 1,3-propanediol, a method for manufacturing 3-hydroxypropionic acid and methods for manufacturing acrolein, acrylic acid and acrylic ester. The dehydration reaction of glycerol is performed under aerobic conditions using microbial cells. This sequence represents plasmid Pl5a DNA used in the method of the invention.

This sequence represents the expression cassette construct phM401-WCS.
This sequence was used in the scope of the invention for the expression of EphA2. BphA2 is a 130 kD receptor tyrosine kinase that is expressed at adherent sequence was used in the scope of the invention for the expression of EphA2. BphA2 is a 130 kD receptor tyrosine kinase that is expressed at adherent. It binds ligands (EphA1 is Al-A5) that are anchored to the cell membrane. Ligand binding causes autophosphorylation, however EphA2 corrections corporated action of the invention of the absence of ligand binding or phosphoryrosine content. EphA2 is upregulated on a large number of hyperproliferation cell; including aggressive carcinoma cells. The expressing cell in a subject, involves administering to a subject composition comprising a Listeria bacterium that expresses an EphA2 antique peptide, to elicit an immune response against an EphA2 antique peptide expressing cells bacterium that expresses an EphA2 antique peptide expressing Listeria bacterium, to treat a phA2 captressing cells, involving administering to the subject a composition comprising a human subject having a disease involving betrant angiogenesis involving captrant angiogenesis. The method of the invention is useful for a composition comprising cells, and manner subject having a disease involving aberrant angiogenesis. The method of the invention is useful for a cliciting an immune response against an EphA2-expressing cell in a caption or T cell origin. The cancer is a cancer of skin, lung colon, or eliciting an immune response against method of the subject has a non-neoplastic hyperproliferative disorder. The hyperproliferative disorder is a cancer of skin, lung fibrosis, bronchial asthma, chronic pilmonary obstructive disease, lung fibrosis, bronchial asthma, chronic pilmonary obstructive disease, lung fibrosis, procreasing cells, and sebbracentar angiogenesis and experience of EphA2-expressing a disease involving aberrant angiogenesis.

Creating a subject having a disease in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9133

New recombinant nucleic acid molecule (comprising a first polymucleotide native to a bacterium; and a second reconding a signal peptide native to a bacterium; and a second response in host to antigen.

Folymucleotide encoding a polypeptide) useful e.g. to induce immune response in host to antigen.

Example 13; SEQ ID NO 33; 271pp; English.

Comprising a first polymucleotide (A) encoding a signal peptide native to a bacterium, where (A) is codon-optimized for expression in the bacterium, where (A) is codon-optimized for expression in the bacterium, where (A) is codon-optimized for expression in the bacterium, where (A) is codon-optimized for expression in the bacterium, where (A) is codon-optimized for expression in the bacterium operated polymucleotide (B) is in the same translational reading frame as (A), where (A) encodes a funion protein comprising the signal peptide and the polypeptide, where comprising in the same translational reading frame as (A), where (A) encodes a funion protein comprising a condition in a host (comprising a promoter comprising a promoter comprising a promoter comprising a polyment of preventing or treating a condition in a host (comprising a daministering the recombinant Listeria bacterium to the host), a daministering the recombinant Listeria bacterium comprising a polyment of a tumor-associated antigen, a polypeptide derived from a tumor-associated antigen, an infectious disease antigen, or a polypeptide encoded by (B) comprises an antigen or the signal peptide from Listeria monocycogenes or is a poly encode by (B) comprises from Listeria monocycogenes or is a poly encode by (B) comprises human mesochelin deleted of its signal peptide is an LiO (Isteriolysin O, encoded by (B) comprises human mesochelin deleted of its signal peptide from Listeria monocycogenes or is a poly comprise of peptide from Listeria monocycogenes or is a poly comprise of comprises human mesochelin deleted of its signal peptide and condition in a host to an antigen, and/or secreting an immume response in a hos

The invention relates to a method of eliciting an immune response against an EphA2-expressing cell. The method comprises administering to an individual a composition comprising an EphA2 antigenic peptide, an EphA2 antigenic peptide, an EphA2 antigenic peptide, an anti-idiotypic antipody or its antigen-binding fragment, which immunospecifically binds to an idiotype of an anti-EphA2 antibody, in an amount to elicit an immune response against an EphA2-expressing cell. Also described are: (1) a method of treating a human individual having a hyperproliferative disorder of an EphA2-expressing cell, or a disease involving aberrant anglogeneels, comprising performing the method of the invention; and (2) a method of producing antibodies that immunospecifically bind to EphA2, and administering them to an individual as an EphA2 vaccine. In the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eliciting an immune response comprises administering to an individual composition comprising an EphA2 antigenic peptide, an EphA2 antigenic peptide expression vehicle, or antigen presenting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; SEQ ID NO 43; 241pp; English

the invention, the EphA2 antigenic peptide is NOT any of the sequences given as SEQ ID Nos 3-18 in the specification. The composition further comprises an adjuvant, a heat shock protein bound to the EphA2 antigenic peptide, and expression vehicles expressing the EphA2 antigenic peptide. The expression vehicle is an infectious agent comprising a nucleic acid, comprising a nucleic acid, antigenic peptide operably linked to a promoter, where the sequence encoding the EphA2 antigenic peptide operably linked to a promoter, where the sequence encoding the EphA2 antigenic peptide is codon-optimized for expression in the infectious agent. The method of the invention is useful for treating a human individual having a hyperproliferative disorder of EphA2-expressing cells by administering to the individual a composition comprising antibodies produced by administering an EphA2 vaccine to a host in an amount to treat a hyperproliferative disorder of EphA2-expressing cells. Alternatively, the individual can be administered with carriers in an amount to treat a hyperproliferative disorder of EphA2-expressing cells, and administering to the individual an antibiotic or antiviral agent in an amount to treat a bacterial or viral infection. The methods and compositions of the invention are useful for eliciting an immune response against an EphA2-expressing cell, and for treating a hyperproliferative before of the skin, and minima or manimal cell carring a near mean and an amount to treat a bacterial or viral infection. The hyperproliferative disorder such as cancer (e.g. cancer of the skin, cancing a near manimal cell carring a near mean and an antibiotic or antiviral cell carring a near an entity of an apparent cell carring a near mean and an antibiotic or antiviral cell carring a near mean and an antibiotic or antiviral cell carring and an antibiotic or an amount to mean and an antibiotic or antiviral cell carring and an amount cell carring an antibiotic or an antibiotic or an amount cell carring an antibiotic or an antibiotic o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        renal cell carcinoma or melanoma), a non-neoplastic hyperproliferative disorder (e.g. an epithelial cell disorder, specifically asthma, chronic pulmonary obstructive disease, lung fibrosis, bronchial hyper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 responsiveness, psoriasis, or seborrheic dermatitis), or a disease involving aberrant angiogenesis (e.g. macular degeneration, diabetic retinopathy, retinopathy of prematurity, vascular restenosis, infantile hemangioma, verruca vulgaris, Kaposi's sarcoma, neurofibromatosis, recessive dystrophic epidermolyysis bullosa, rheumatoid arthritis, ankylosing spondylitis, systemic lupus, psoriatic arthropathy, Reiter's syndrome, and Sjogren's syndrome, endometriosis, preeclampsia, atherososlerosis or coronary artery disease). This sequence represents a plasmid containing a multiple cloning site (MCS). It is used in the exemplification of the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the nucleotide sequence of the plasmid pRZTL1 which is used to demonstrate in vitro transposition of a transposable element located between a pair of Th5 (transposans) outside end (0B) termini. The invention provides a genetic construct that contains a nucleotide invention provides a genetic construct that contains a nucleotide sequence encoding a modified Th5 transposase enzyme that has both greater avidity for Th5 OE repeats and is less likely to assume an inactive multimeric form than a wild type Th5 transposase and a transposable DNA sequence flanked at its 5' and 3' ends by an 18 or 19 base pair flanking. DNA sequence comprising nucleotide A at position 10, T at 11 and A at 12. The modified Th5 transposase and the transposable DNA which is a DNA donor molecule are used in a system for in vitro transposition. The system and method can be used to create absolute defective mutants, to sprovide selective markers to target DNA, to provide portable regions of homology to a target DNA, to facilitate insertion of specialised DNA sequences into target DNA, to facilitate insertion of specialised DNA sequences into target DNA, to provide primer binding sites or tags for DNA sequences into target DNA, to provide primer binding sites or tags for expression studies and protein domain mapping, as well as to bring togenetics). The modified Th5 transposase facilitates in vitro transposition reaction rates of at least about 100-fold higher than ten to circular or linear. The system also use donor DNA and target DNA that is circular or linear. The system also negatives or outside high
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2092

The insertion of the Th5 transposase releases a fragment of the plasmid that corresponds to the region of Kanamycin resistance gene that lies between the two OB sequences. The plasmid was also used to investigate the nature of the termini involved in the transposition reaction. Wildtype Outside End (OB,AA206435) and Inside End (IE, AA206438) were compared and an effort made to randomise the nucleotides at each of the seven positions of difference. This eventually lead to the identification of the mutant OB sequences AA206436 and
